

An Introduction to RNA-sequencing

Differential Expression Analysis

W. Evan Johnson, Ph.D.
Professor, Division of Infectious Disease
Director, Center for Data Science
Co-Director, Center for Biomedical Informatics and Health Al
Rutgers University – New Jersey Medical School

2025-07-28

Installing R Packages:

Install the following tools: Rsubread, Rsamtools, and SummarizedExperiment. We will also need help from the tidyverse.

Load Packages for Today

We will be using the following packages for today's lecture: We will be using the following packages for our RNA-seq lecture:

```
library(tidyverse) ## tools for data wranging
library(Rsubread) ## alignment and feature counts
library(Rsamtools) ## managing .sam and .bam files
library(SummarizedExperiment) ## managing counts data
library(edgeR) ## differential expression
library(DESeq2) ## differential expression
library(ComplexHeatmap) ## Heatmap visualization
library(TBSignatureProfiler) ## TB signature analysis
library(umap) ## dimenstion reduction and plotting data
```

Using Rsubread to do Alignment

The following userguide will be helpful for you:

http://bioinf.wehi.edu.au/subread-package/SubreadUsersGuide.pdf

Indexing your genome

Note that you will rarely do this for human alignment. You will usually download an existing index given to you by others who have already done this work. You will do this often if you are aligning microbial reads, e.g. MTB or some other organism for which others have not already made your index for you.

```
buildindex(basename="example_data/genome/ucsc.hg19.chr1_120-150M",
    reference="example_data/genome/ucsc.hg19.chr1_120-150M.fasta.gz")
```

Took me ~0.2 minutes!

Aligning your reads:

Note that this outputs results in a .bam file and not a .sam file

My old laptop was an Apple M2, with 8 cores (used 4 cores), 24GB RAM:

- ► Took 15.7 minutes to align ~60M reads to the 30M bases
- ► Took 0.7 minutes to align ~6.5M reads to the 30M bases
- ▶ Took 0.3 minutes to align ~500K reads to the 30M bases

Algning the reads using STAR

This afternoon we will use the STAR aligner on Amarel to align a set of RNA-seq fastq files!

Aligned Sequencing Data Formats (SAM and BAM)

Note that Rsubread outputs a .bam file (bam = binary alignment map) and not a .sam file (sam = sequence alignment map). Here is some information about a .sam file: $\frac{1}{e^{-h}} = \frac{1}{e^{-h}} = \frac{1}{$

Col	Field	Type	Regexp/Range	Brief description
1	QNAME	String	[!-?A-~]{1,255}	Query template NAME
2	FLAG	Int	[0,2 ¹⁶ -1]	bitwise FLAG
3	RNAME	String	* [!-()+-<>-~][!-~]*	Reference sequence NAME
4	POS	\mathbf{Int}	[0,2 ²⁹ -1]	1-based leftmost mapping POSition
5	MAPQ	Int	[0,2 ⁸ -1]	MAPping Quality
6	CIGAR	String	* ([0-9]+[MIDNSHPX=])+	CIGAR string
7	RNEXT	String	* = [!-()+-<>-~][!-~]*	Ref. name of the mate/next segment
8	PNEXT	Int	[0,2 ²⁹ -1]	Position of the mate/next segment
9	TLEN	\mathbf{Int}	$[-2^{29}+1,2^{29}-1]$	observed Template LENgth
10	SEQ	String	* [A-Za-z=.]+	segment SEQuence
11	QUAL	String	[!-~]+	ASCII of Phred-scaled base QUALity+33

Aligned Sequencing Data Formats (SAM and BAM)

To convert .sam to .bam or vice versa, a package called Rsamtools. Using Rsamtools, you can convert bam to sam as follows:

Feature counts

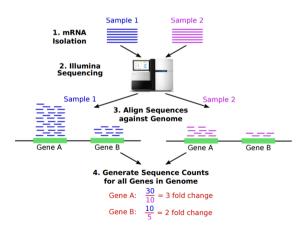

Now we can count reads hitting genes. Approaches/software:

- ► HT-Seq
- ► STAR
- Cufflinks
- RPKM FPKM or CPM
- RSEM
- edgeR
- findOverlaps (GenomicRanges)
- featureCounts (Rsubread)

Feature counts

Feature counts

```
fCountsList = featureCounts(
  "rna seg/alignments/R01 10 short.bam".
  annot.ext="rna seq files/genome/genes.chr1 120-150M.gtf",
  isGTFAnnotationFile=TRUE)
featureCounts = cbind(fCountsList\u00a4annotation[,1],
                      fCountsList$counts)
write.table(featureCounts,
    "rna seg/alignments/R01 10 short.features.txt",
    sep="\t", col.names=FALSE, row.names=FALSE, quote=FALSE)
```

Data Structures

A data structure is a particular way of organizing data in a computer so that it can be used effectively. The idea is to reduce the space and time complexities of different tasks.

Data Structures

Data structures in R programming are tools for holding multiple values, variables, and sometimes functions

Please think very carefully about the way you manage and store your data! This can make your life much easier and make your code and data cleaner and more portable!

Data Frames

A large proportion of data analysis challenges start with data stored in a data frame. For example, we stored the data for our motivating example in a data frame. You can access this dataset by loading TBNanostring.rds object in R:

TBnanostring <- readRDS("example_data/TBnanostring.rds")</pre>

Data Frames

In RStudio we can view the data with the View function:

View(TBnanostring)

Data Frames

Or in RMarkdown you can use the datatable function from the DT package:

datatable(TBnanostring)

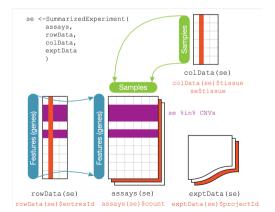

You will notice that the TB status is found in the first column of the data frame, followed by the genes in the subsequent columns. The rows represent each individual patient.

Advanced Data Structures

There are advanced R data structures that can facilitate object orientated programming. One useful example is the **SummarizedExperiment** object.

Make a SummarizedExperiment

Using an example dataset from: Verma, et al., 2018

```
## read in data
counts <- read.table(</pre>
  "example data/features combined.txt",
  sep="\t", header=T, row.names=1)
meta data <- read.table(</pre>
  "example data/meta data.txt",
  sep="\t", header=T, row.names=1)
group <- meta data$Disease
```

Make a SummarizedExperiment

List of length 4
names(4): counts log_counts counts_cpm log_counts_cpm

Implements statistical methods for DE analysis based on the negative binomial model:

```
#Gene Filtering
counts<-counts[which(rowSums(counts)>100),]
#Computes library size
dge <- DGEList(counts=counts, group=group)</pre>
#TMM normalization
dge <- calcNormFactors(dge)</pre>
# Design matrix
design<-model.matrix(~Disease, data=meta_data)</pre>
#Estimates common, trended and tagwise dispersion
dge<-estimateDisp(counts,design)</pre>
```

In negative binomial models, each gene is given a dispersion parameter. Dispersions control the variances of the gene counts and underestimation will lead to false discovery and overestimation may lead to a lower rate of true discovery.

```
